

WE'RE LOOKING FOR

INNOVATIVE ENVIRONMENTAL SOLUTIONS THAT WORK!

Large scale or small scale, high-tech or low-tech, city level or community level? We know that interesting and successful examples exist, and we want your help to find them!

SKL International is making an inventory of environmental solutions that could be successfully implemented in developing countries. Solutions could provide innovative ways of addressing issues like mobility, water, sanitation, energy, housing, waste, air pollution, climate change and public space.

They might be innovative because they are low-cost, use appropriate technology or are easy to implement and maintain. They don't have to be technical in nature – they might focus on behavior, attitude, incentives and disincentives to promote sustainability.

Selected examples will be featured in a publication on Innovative Environmental Solutions and used to inspire cities in finding new ways of addressing urban challenges.

If you know of an innovative environmental solution that works, send us an email, a link, a report or a YouTube clip at innovation@sklinternational.se

Great idea!
MAKE A SOLAR BULB

Use an old plastic bottle. Make sure to wash the bottle and remove any labels.

1.

2.

Fill the bottle almost to the top with clean, filtered water.

Add three tablespoons of bleach to the water, and allow to settle without shaking.

3.

4.

Seal the bottle and fit it into the ceiling of your choice. Remember to leave the top exposed to allow sunlight to pass through.

What's your great idea?
